TERMS AND CONDITIONS

Prices are subject to change without notice.

Terms are net cash, 30 days from date of shipment, unless otherwise specified.

Where we erect either tanks or towers, final payment is due upon completion of the work.

If customers do the erecting, we require payment to be made in the time agreed upon, whether the erection has been completed or not.

Our responsibility for delivery ceases when we secure a signed bill of lading from the Transportation Company for goods received in good order.

Customers must look to the R. R. Co. for any loss due to delay in delivery or damage sustained in transit. We are always glad to file claims for them when desired.

Claims must be made within 15 days after receipt of the goods.

If goods are not as ordered, or will not go together properly, customer must notify us and we will promptly ship correct parts or authorize him to have trouble corrected.

No claims for repairs of any kind, or for the replacing of materials, will be allowed unless we authorize same.

All Galvanized Steel Tanks that we ship set up are carefully tested to see that they are water-tight before being shipped, and purchasers are cautioned to examine such tanks thoroughly before accepting them from the Railway Company, as we cannot allow any charges for resoldering them, or repairing of any other kind.

Wood Tanks are shipped knocked down and well crated; when requested, we send suggestions explaining how erection should be done.

Receiving a tank or tower and setting it up constitutes an acceptance of it.

We cannot accept the return of any goods, as all tanks, towers, etc., are made up especially for each order.

When goods are ordered without details being specified, we will furnish what we think is suitable, and at our regular prevailing prices.

All contracts for the completion of work in a specified time are subject to fires, strikes, delays of Transportation Companies, breakage of machinery, accidents or other causes beyond our control.

ENGINEERING

THE founder of this Company started as an engineer and contractor specializing in building Flour Mills and Distilleries. He found that a woodworking and later foundry and machine shops would assist him in getting his material prepared as he wanted it. From this, the present plant grew, which now also includes structural and plate steel shops.

From the very beginning engineering has been the keynote of the success of this business. Without it today, the building of elevated tanks and towers would not be possible. Way back in 1892 our Tubular Tower was patented. It was the very first standard line of towers built on engineering principles. It was so well designed that we make it today practically the same as it was made then. Since then, we have designed other types as the need arose and they too have had few changes.

The wide range of character and usage of our products has been a natural consequence of our engineering view point. Practical experience however, has not been lacking for we have been making wood tanks for fifty years and steel tanks more than forty years. It is therefore, easy to see why a Caldwell Tank has come to be known as "The Tank with a Reputation."

Our long experience as well as our engineering staff is at your service. We will gladly give you, without charge, technical service on any tank problem, particularly where mechanical equipment is to be used, as we also manufacture friction clutches, pulleys, etc.

We have not attempted to list, in the limited space of this catalog, all the different kinds of tanks and towers we manufacture, but only the standard types and to indicate a few of the others. We will be glad to quote you on anything in our line whether it is illustrated herein or not.

WOOD TANKS

Round, Rectangular or Other Shapes

For Rectangular Wood Tanks see pages 16 and 17

The life and tightness of a wood tank depends on the use of proper materials, design and workmanship. We own Cypress timber in Louisiana and cut it in our own mill to insure proper materials. During our fifty years of making wood tanks we have developed the best designs and learned what to do and what not to do to insure long life in a wood tank.

A wood tank has certain advantages over other kinds. It requires less care and painting, it gives better protection from freezing and heat and for use with hard or corrosive waters, will last longer than steel. It is also used for holding a great many chemicals where metals would be entirely unsuitable or too expensive.

A properly made wood tank should hold most liquids without any foreign matter or splines in the joints. The necessity of using other than a wood to wood joint indicates faulty manufacture or erection except for certain chemicals and fats.

KIND OF WOOD

CYPRESS—Red Gulf Cypress is easily the best tank wood for general use on account of its great durability. It is our specialty and we were the first to use it in the manufacture of tanks. The records show that Cypress, unlike other woods, does well when out of its native climate. It grows in a hot swamp and nature has given it extra protection.

We make only two grades of Cypress tanks; our Standard Grade, which is all heart on the inside and only a limited amount of clear sound sap on the outside and free of defects that would affect its tightness or life and our All Heart Grade, which is also free of sap. There is also a "Select" grade sold by others but not by us. This grade, while it is Cypress, can contain any amount of sap and therefore has short life. Our Fir tank will last much longer and cost less.

Cypress is the best for water, either hot or cold, as it does not swell or shrink as much as other woods. It resists the action of alkalis, many acids, and other chemicals better than other woods, and is therefore largely used in chemical and allied trades. Cypress gives off no color, taste or odor and on this account is especially suited for holding drinking water, cider, vinegar, fruit syrups, or other food products.

FIR—Fir has many of the qualities of Cypress, both for water and for chemicals and it is equal to Cypress in resisting certain acids and chemicals. For water its life is somewhat shorter but as it costs less it is recommended when something less expensive than Cypress is wanted. It is usually used for pickle tanks and sometimes for kraut.

REDWOOD—Redwood is the best of the western woods for tank purposes. It has lasting qualities that approach those of Cypress. It is unusually free of defects and costs less than Cypress in the larger sizes.

YELLOW PINE—Long Leaf Yellow Pine (we do not use the short leaf variety) is furnished only in our special tank grade cut to our own specifications. Do not confuse it with the grades used in cheap yellow pine tanks. It is used chiefly in industrial tanks of large size, which require greater thickness of material, such as pickling and paper mill tanks. It is also used for holding certain acids and chemicals, particularly sulphuric acid.

OTHER WOODS—Poplar, White Pine, "White Cedar" (really Juniper), Oak, Maple and other woods are sometimes used for tanks. They are decidedly inferior to the regular tank woods for the usual purposes. Some, however, have unique qualities that adapt them to certain special purposes. For instance, Quarter-Sawed White Oak is used for wine and spirit tanks.

LININGS

We are prepared to line either round or rectangular tanks with Rubber, Lead, Copper, Stainless or Galvanized Steel, Monel Metal, the Acidproof Bronzes, or any other lining required.

TANKS
AND
TOWERS

ROUND WOOD TANKS

See prices on pages, 6, 7, 8, and 9

A round tank should be used wherever possible in preference to other shapes, for its construction and bracing is much simpler and therefore it costs much less to make and erect.

SIZES

We can make any size of tank you want, but, as a matter of economy, it is best to select from the sizes that are cut from standard lengths of lumber. The sizes which are most in demand are listed on pages 6, 7, 8 and 9, and the standard sizes are printed in heavy type.

CONSTRUCTION

The bottom pieces are dressed, ripped, machine jointed and well doweled. The edges are chamfered for the croze or groove in the staves but left a little thicker to allow for possible shrinkage before erecting. A thin shaving must be taken off with a hand-plane in erecting to make a driving fit with the croze in the staves. The staves are dressed, ripped, and machine jointed and croze or groove cut to suit the circle of the bottom and the taper of the tank. (See cut of detail below.)

HOOPS

The hoops, usually round, are wrought iron instead of steel so they will not rust as easily. But Brass, Galvanized, Lead Covered, Bronze, Monel Metal or other kinds can be furnished.

The proper number and size are carefully calculated to give ample strength with a factor of safety of four to one. They are cut to the exact lengths necessary to suit the taper of the tank and are bent to the proper circle. The threads are machine cut, not rolled on, and the hoops are full size throughout. The connecting lugs are of malleable instead of cast iron and the necessary nuts are furnished.

ROUND WOOD TANKS—Continued

MARKING

The bottom pieces of all tanks are marked and numbered, as are the hoops, but the staves are not, as they will go in anywhere they are placed, it only being necessary to fit the last stave. We always send a few inches extra in width so this can be done. A Blue Print plan is supplied showing how to space hoops so that each will bear the strain it is calculated for and no more.

METHOD OF CRATING

Particular attention is paid to the crating of our Tanks and to having all crates and pieces plainly stenciled with the name and destination, so that we have a minimum of complaints of broken crates or lost pieces, although many of our shipments are to points in New England, Canada and west of the Mississippi. For export all parts are boxed.

ERECTION

Be sure the foundation is strong and rigid enough for the load and will support the bottom only. The staves must have at least one-half inch clearance on all sides.

Lay bottom according to marks and drive tightly together so joints are good the full length. Use a wood block to hammer against. Dress a thin shaving off the top edge of the bottom, just enough to make a driving fit with the croze in staves. (See cut.)

Drive staves close onto bottom and up tight against each other edgewise taking care not to jar loose other staves. Make no allowance for swelling and see that joints in staves do not come in line with joints in the bottom. Rip, plane and fit the last stave exactly into the space left. By saving four or five of the narrower staves to the last these may be selected so that little fitting may be necessary. Where several tanks of a size are being erected, a stave from one of the other tanks can usually be found to fit the space without having to cut it. Toe nails or blocks nailed on top will hold the staves till all are on.

A rope thrown around the top and twisted up tight will hold the tank while putting on the hoops. Mark the spacing of the hoops from the blueprint on four or five staves around the tank. Start at the bottom and place hoops according to the marking, using staples or small nails to hold them. The lugs should be placed spirally around the tank. When all are set, draw up tight using only an 8-inch wrench for $\frac{5}{8}$ -inch hoops, 10-inch for $\frac{3}{4}$ -inch hoops or 15-inch for $\frac{7}{8}$ or 1-inch hoops. After hoops are on bring staves to an even surface by pounding on a wood block held against the staves.

The tank should be filled as soon as possible after it is completed. It often takes several days after tank is filled before all joints swell tight.

Paint tank two coats on outside only, using good lead and oil paint. Paint hoops one coat before erection.

CAUTION—Never put any caulking, paint or foreign substance in the joints and do not paint the tank on the inside.

If any parts do not fit, do not use but notify us immediately.

KEY TO PRICE LIST OF ROUND WOOD TANKS

Tell Us

Capacity in gallons, not in barrels; or state inside diameter and inside depth, or outside height, thickness and kind of lumber and intended purpose; also if a Cover (P. 12), Gauge (P. 13), Tower (P. 29-36), or other articles, are wanted.

Taper

All Tanks are regularly built with a taper of one inch to the foot, but tanks without taper can be furnished at a slight additional cost.

Capacities

Are based on straight staves, viz., Tanks without any taper. The capacity of tanks as regularly furnished is therefore somewhat less than the listed capacities.

Dimensions

Are given for inside measurements for both diameter and depth; for outside length of stave add for 1½ inch lumber 4½ inches; 2 inch, 5 inches; 2½ inch, 5½ inches and for 3 inch, 6 inches. This allows us 2 inches for squaring up the ends of the lumber, viz., 12 foot lumber will be finished up 11 feet 10 inches long, etc.

Standard Sizes

Tanks listed are the standard sizes that cut to best advantage from standard lengths of lumber, which comes in lengths of even feet. We can supply tanks of any other sizes that may be required.

Material

Is Cypress, Redwood, Fir and Long Leaf Yellow Pine. We can furnish other woods if required.

When to Use Each Thicknesses Used

Read carefully pages 2 and 3

Cypress is furnished in 1½, 2, 2½, 3 and 4 inch; Fir and Redwood in 2, 2½, 3 and 4 inch; Yellow Pine in 2, 3, 4, 6, 8, and 10 inch.

Thicknesses Recommended

Cypress, Redwood and Fir, 2 inch for tanks not over 14 feet 0 inch diameter and 13 feet 5 inches deep (although 1½ inches may be used for tanks under 8 feet 0 inch diameter by 7 feet 5 inches deep); 2½ inch for tanks 16 to 20 feet diameter inclusive and 3 inch for larger sizes; 2½ inch may be used for staves with 3 inch bottoms up to 24 feet diameter by 19 feet 4 inches deep.

Note.—The above is for ordinary purposes. Thicknesses must be increased for special purposes and for some uses 4 inch Cypress is required of which we carry a large stock.

For hot water 2½ or 3 inch All Heart Cypress is recommended. Long Leaf Yellow Pine tanks are the same as above except for special purposes which usually use 4, 6 and sometimes 8 and 10 inches thick.

Splicing

Staves and bottom boards are made in one-piece except that lengths longer than 16 feet, when not available, may be spliced.

Discounts

Discounts and freight rates will be quoted on application; or we will name net delivered prices if size of tank is given.

Hoops and Lugs

Round hoops with lugs are standard and are furnished unless otherwise specified. Round hoop sections are not over 20 to 22 feet long and one lug is furnished for each section.

Galvanized Hoops and Lugs

These hoops and lugs either round or flat can be furnished galvanized at a slight additional cost.

Shipping Weights

Are the same for Cypress, Redwood, Fir, White Pine, White Cedar and Poplar. Long Leaf Yellow Pine weighs about 40 per cent more than Cypress.

Method of Shipment

Tanks are never put together at the factory, unless ordered set up, but are got out from standard templets and shipped knocked down, and well crated. Enough staves are sent to allow for dressing off and fitting in the last one. Hoops are cut to lengths and a plan supplied showing how to space them. See Page 4.

Erection

We will quote prices erected where desired—state how high above ground tank will go and whether on trestle or a building.

Foundation Plans

We can furnish customer plans for building foundations for tank to suit any conditions. Standard plans for tank foundations on the ground furnished without extra cost.

Other Prices

Prices for Plain Round Tanks are listed on Pages 6, 7, 8 and 9. Prices for other styles illustrated or any other kind wanted, will be quoted on application.

LIST PRICES OF ROUND TANKS

Cypress, Redwood, Fir and Yellow Pine

For Redwood use Cypress lists and weights. For Yellow Pine use Fir lists and add 40% to weights.

See description on pages 2 to 5. Covers, etc. on pages 12 and 13.

GRAVITY TANK ON BUILDING TO SUIT INSURANCE REQUIREMENTS

These prices are for tanks built to suit the requirements of either the Factory Mutual Insurance Companies or any of the Stock Companies. Such tanks are required to be built of a certain size for a given capacity and to be provided with round iron (not steel) hoops of a specified number and size. They must be constructed of 2½ inch material if of 20,000 gallons or less, and of 3 inch for larger sizes.

If furnished complete, the tanks must be provided with a Conical Roof, covered with Shingles, Rubberoid or Metal, and an Inside Flat Cover for frost proofing, together with an indicator or Tank Register, an Inside Wooden Ladder, and an Outside Iron Ladder extending three feet above the tank with ends curved over.

SPECIAL ROUND WOOD TANKS

HALF-ROUND TANKS

Furnished in any size wanted. State inside dimensions in asking for prices.

ELLIPTICAL TANKS

Furnished in any size. State inside dimensions in asking for prices. Note the short diameter should always be at least a little bit more than half the long diameter or the sides will be too flat for good stability.

DISHED BOTTOM TANKS

DOUBLE HEADED TANKS

CONE BOTTOM TANKS

HORIZONTAL OR ROUND WAGON TANKS

In asking for prices, be careful to give the outside diameter and length that can be used.

COVERS FOR ROUND WOOD TANKS

Standard Conical Cover.

Furnished with Rubberoid Roofing, Shingles or Tin.

Conical Cover.

Arranged for Frost Protection with Inside Flat Cover Supported by Joists.

TANK GAUGES

MERCURY TANK INDICATOR

It is connected to the tank by a small pipe, or can be connected to any existing pipe leading directly to the tank where the velocity of the water is not great enough to decrease the pressure.

Price each without mercury.....\$96.00

Price of Mercury on application.

INDICATOR, GAUGE AND FLOAT

This Gauge is of wood, laid off in feet and parts of a foot, having a white background with three-inch figures painted thereon in black and is furnished with a brass chain for attaching the sliding gauge and a copper ball float with pulleys over which the chain runs.

This is neat and substantial and inexpensive.

Indicator, Gauge and Float.

TANK FOUNDATIONS

On the Ground or on Buildings

The importance of adequate and properly designed foundations is not fully appreciated by most people. *Poor foundations cause a great many tanks to leak.*

There are three cardinal principles to be observed in designing foundations.

1st. The weight must be supported from the bottom only. The staves of wooden tanks must not carry any of the load and where the tank is to rest on a level surface it is best to use dunnage or sub-joists as listed below which will support the bottom and raise the ends of the staves free.

2nd. The supporting pieces under the bottom must not be spaced over eighteen inches apart or preferably less and the bottom boards of wood tanks must run across the dunnage or joist supporting them.

3rd. The foundations must extend below the frost line when on the ground.

Realizing to what an extent the success of a tank depends on its foundation, we have made a careful study of tank foundations and have developed a series of standard designs which are not only of the proper strength but which contain the least amount of material that will develop this strength. The material has been put in the shape and place where it will do the most good.

We will furnish, when desired, a detail plan of foundations on the ground for the standard tanks we sell without extra cost and you can furnish your own materials or we can furnish the necessary wood joist and bridging cut to the proper lengths and ship them with the tank. See prices on the opposite page.

The placing of a tank on a building is a dangerous proceeding unless certain precautions are taken. If the building has not been especially designed to carry a tank, it should be examined and passed on for strength of walls, etc., by some reliable engineer or architect before attempting to put a tank on it. Any new brick work required should be set in cement mortar. The foundation itself is very important and should be designed *only* by some competent engineer *familiar with tank work*, as we find the *average* architect or engineer has not had the experience required, nor given the subject the close thought it deserves.

The design of tank supports has problems not usually found in other branches of engineering.

We are frequently asked to quote on designs of others and in most cases we either find some part of the structure too weak or, if of ample strength, the material was not placed economically. In a recent case our design cost less than one-half of that of the architect and was of equal strength.

Only round hoops should be used with a wood tank on a building.

Prices on application.

DUNNAGE OR SUB-JOISTS FOR TANKS

These prices are for the sub-joists only. Customers are sure of having these timbers fit the tank if ordered of us.

These are of Special Grade Long Leaf Southern Yellow Pine or Oregon Fir, cut to the proper circle to suit diameter of Tank, and are painted one coat.

Prices on Sub-Joists

STANDARD DUNNAGE OR SUB-JOISTS

Cut shows tank bottom being laid on Dunnage. Circle of Dunnage should be about 4 inches less than tank bottom.

TANK FOUNDATION ON BUILDING

On Corner Walls

Caldwell
TANKS
AND
TOWERS

RECTANGULAR WOODEN TANKS

**Built with or
without Partitions**

In the construction of Rectangular Tanks, a greater amount of mechanical knowledge and experience is necessary than in Round Tanks and there is no standard practice that is readily accessible to the uninformed, as with Round Tanks, so that besides ourselves, there are practically only one or two other concerns that successfully build this kind of a tank.

We can furnish this style of tank with or without partitions, false bottoms, etc., or with lead, copper or other lining when required. We can furnish brass, copper, bronze, galvanized, lead covered or Monel Metal rods instead of iron and, when required, we counter-sink the nuts on top and cover with a hardwood coping.

SIZES

There are so many possible sizes of rectangular tanks that we do not attempt to list them and will quote, on application, prices for any size you wish. Standard lengths of lumber are in even feet and will make rectangular tanks of about one foot less length, so for economy, the odd feet or slightly less should be selected for the length of the tank and the other dimensions to give the required capacity.

KIND OF WOOD

For the kind of wood to use for different purposes see page 2.

RECTANGULAR WOODEN TANKS—Continued

Brace Rods Through Center

Brace Rods Over Top

Outside Truss Bracing

CONSTRUCTION

We have been building this style of tank for a great many years and were the first to adopt a standard method of construction which we have reason to believe, from long experience, is about the best possible method.

The bottom is crozed (or grooved) to receive the sides and ends and the sides are crozed to receive the ends. This gives a water tight wedged joint even without the pressure of the rods which are used to draw all parts tightly together and this croze also holds the sides and ends from bulging at the bottom.

The rodding is thorough and the sizes and spacings are carefully figured out by our engineering department to give a full factor of safety of 4 to 1 with the liquid used so that no bursting or bulging is possible.

When the length exceeds certain proportions for each thickness the sides are braced against bulging. The simplest and best method is by rods through the center of the tank and is used where their presence is not an objection; otherwise, by battens in the center with a rod passing over the top and another through the bottom of the tank. Still another method is to truss the sides on the outside by iron rods, or by a wood truss if the iron is objectionable. See illustrations above of the three methods.

We also make these tanks with rounded or tapered bottoms, sides or ends or to fit machines of which they are a part, such as dyeing or paper machines. See page 19 for illustration of rectangular acid pickling tank.

SHIPPING AND ERECTION

Rectangular tanks can be shipped set up but, on account of higher freight rates, they usually are shipped knocked down. The sides, ends and bottoms are each put together and shipped in one section except in very large sizes when such pieces would be too large or heavy to handle. All holes for rods are bored and rods put in place with blocks on the ends of the thickness of the part they have to pass through. Customer in receiving Tank has only to take off blocks and nuts

**Cut Showing How Rectangular Tanks are
Manufactured Ready to Go Together**

and after dressing off a thin shaving (just enough to make a tight fit into the grooves) on inside of side and ends, which takes only a few minutes, let them down into the groove in the bottom, place the battens in position, put the washers and nuts back in place, and then draw the rods up. The sides and ends are left the least bit thicker than the groove in bottom to allow for shrinkage in transit, and to permit of an exact fit in erecting.

INDUSTRIAL TANKS

We are designing engineers and can design and give you estimates on any equipment even including complete plants. We specialize on tanks of individual design or with mechanical attachments. We can also furnish linings of lead, rubber, monel or other metals or complete tanks of stainless steel, nickel, bronze, etc.

TANK AGITATORS OR STIRRING DEVICES

**BELT DRIVEN PADDLE TYPE
WOOD AGITATOR**

The standard paddle agitator may consist of either a Fir or Yellow Pine wood vertical shaft with beveled wood stirrer arms fastened on with brass or other resistant metal bolts and step and toe bearing of suitable metal or where no damage will result to the contents or agitator, of steel shaft and arms with cast step and toe.

The standard and least expensive drive is by heavy cast bevel gears, steel shaft and cast iron tight and loose pulleys mounted on framed Yellow Pine bridgetrees.

Steel bridgetrees, unit drive in a cast frame, sprocket, jaw clutch, Caldwell Friction Clutch or direct gearmotor drive may be used at added cost. See illustrations.

The standard range of sizes are of sufficient strength to handle quite thick materials but special designs can be made to suit any requirements.

This agitator is made to fit either wood or steel tanks and all parts are fitted ready to assemble and fit to the tank. Any good mechanic can do this easily from the blueprint we furnish.

OTHER TYPES

There are many other types and we illustrate those in most common use. They are mostly for special purposes and designed for each case. The toothed agitator shown is used in distillery yeast and mash tubs in connection with cooling coils.

Tell us the size tank, the results desired and the kind and consistency of the material to be stirred.

Tank agitators are of many types to suit the many different materials and conditions encountered and we are prepared to furnish most any type needed.

We have found from our long experience that in most instances and particularly liquids and even thick solutions the simple paddle type illustrated is best suited, costs less and is more efficient than any other type. We have furnished more of this type than all others together.

The action of this agitator is to raise the material from the bottom up the sides and down the center with only the minimum amount of turbulence and swirl required for thorough mixing. University laboratory tests have shown it surprisingly efficient and also that it should be driven at the proper speed to get the maximum efficiency.

**DIRECT GEARMOTOR
DRIVEN TOOTH AGITATOR**

TANK AGITATORS OR STIRRING DEVICES

We manufacture all parts of our agitators in our own machine, mill-wright, structural and plate shops and iron and special metal foundries.

We also manufacture a complete line of power transmission machinery including the Caldwell Friction Clutch described below. Send for special catalog.

DISTILLERY MASH TUB

HAND MIXING TANK
With Glass Gauge

UNIT DRIVE IN CAST FRAME

GATE AGITATOR

PUG MILL

BRONZE PROPELLER

CALDWELL FRICTION CLUTCHES

We have been manufacturing this clutch for a number of years and believe it excels any other on the market. It is made in capacities from 1 to 240 horsepower.

Its notable features are its simplicity, strength, ease and perfection of adjustment and freedom from breakage.

The basic principle is identical with that of the standard automobile service brake; a flexible band lined with asbestos and tightened with a single lever. In practice it has given equal service with that much used and abused device.

There are only eleven parts.

There is only one adjustment. One screw shortens or lengthens the band which

gives equal pressure everywhere around the entire circumference of the friction band.

RECTANGULAR STEEL TANKS

Riveted or Welded

Open or Closed

There are no standard sizes of rectangular steel tanks as they are usually made to suit special requirements. The smaller sizes are usually welded and shipped set up while the larger sizes are usually riveted and shipped knocked down, thoroughly marked and with rivets to erect.

We make them of any size and any suitable thickness. The sides and ends are thoroughly braced by angles, bars or rods wherever required to prevent bulging.

Write for net prices including freight to your city.

GALVANIZED STEEL TANKS

RELIABLE GALVANIZED ROUND STORAGE TANKS

The capacities are nominal and sizes are approximate overall measurements.

These tanks are made of heavily galvanized steel sheets properly braced. The seams are reinforced and soldered for water tightness.

Sizes too large to load through box car door are made up as far as possible and shipped knocked down ready to assemble with necessary rivets and solder furnished.

The gauges listed are the recommended thicknesses. Prices for heavier tanks will be quoted upon application.

STANDARD STEEL TOWERS

FOR WOOD OR STEEL TANKS

We illustrate on the following pages three distinct types of steel towers, Angle Column, Tubular Column and Latticed Column.

The Angle Column Tower is the simplest and least expensive, the Tubular Column Tower is our original patented tower and is considered by many as the best appearing and the Latticed Column Tower is of bridge construction, the same as our largest towers. All are designed for the full dead load and a hundred mile wind with full factor of safety.

Each class tower is designed only for tanks of specific sizes which are given in the table below.

In asking for prices, state the kind of tank (wood or steel), capacity in gallons, the kind of Tower and the height and what Insurance Requirements are to be complied with, if any; also whether we shall include the Riser Piping and Frost Boxing for Riser Pipes and Erection in our estimate.

Angle Column Tower

ANGLE COLUMN TOWER

This is our simplest and most economical tower. It is made in capacities of from 500 to 50,000 gallons and in heights which are multiples of 10 feet for all except the largest which are in multiples of 15 feet.

It is not to be confused with the flimsy angle towers of the windmill type for it is designed with the same safety factors and wind velocities that we use in our heaviest towers for tanks up to a million gallons.

We have been making this tower for many years and have made thousands of them and as far as we can determine all are still standing.

It is furnished with bolted connections but can be riveted if so desired. Either way it is easy to erect.

It is designed to have a full factor of safety of four to one even when the wind is blowing at one hundred miles per hour. It has an allowance for corrosion so that it is only necessary to paint it. However, at extra cost, it can be furnished galvanized; that is hot dipped after fabrication and not just made of galvanized material.

Under 20,000 gallons capacity, the tank foundation at the top of the tower can be of either wood timbers or steel beams and in the larger sizes it is of steel only. A walkway and handrailing with steel ladders from 10 feet above the ground to the top of the tank are furnished on all sizes.

These Towers are acceptable to any and all Insurance Companies. In asking for prices state what Insurance Requirements, if any, the outfit must comply with; the kind of Tank (wood or steel), Capacity in gallons; Height of Tower and if we are to include Riser Piping and Frost Boxing for Riser Pipes and Erection in our estimate.

TUBULAR COLUMN STEEL TOWER

This is our original steel tower and was designed thirty years ago. It still meets all modern requirements in design and is preferred by many on account of appearance and other advantages.

It is built with four columns and is constructed for Tanks from 1,000 to 40,000 gallons.

The columns of these Towers are cut off square at the ends and then faced in a lathe to insure a true bearing against the internal flange in the heavy socket castings that make the joint connections, this flange also being faced off. These sockets are made on the proper angle to suit the batter of the Tower, and have a boss that is tapped to receive the extra long threaded ends of the round steel rods that are used for sway bracing. These rods are provided with drop forged turn-buckles to secure proper tension.

The Tower is the simplest in design of any on the market, and the easiest to erect as the use of socket connections does away with all riveting and makes it unnecessary to use skilled labor in putting it up. Any ordinary mechanic can erect the structure with common labor.

Practically no scaffolding is required as the sections are short and each is just like the others, and one section can be used from which to erect the next. A ginpole with ropes and blocks and wrenches are all the tools required.

In asking for prices state the kind of Tank (wood or steel), capacity in gallons, height of tower, and if we are to include the Riser Piping and Frost Boxing for Riser Pipe and Erection in our Estimate.

See prices on next page

STANDARD DRIVEWAY

A driveway through any of our standard towers can be arranged by the special bracing illustrated at a small additional cost. In our Latticed Column Tower there is usually sufficient clearance for a driveway without any change. This design is very simple but structurally correct.

Tell us whether the driveway goes straight through or turns under the tower and also the clearance required; that is, the height above the grade line and the width at this height.

ALL STEEL HEMISPHERICAL AND ELLIPSOIDAL BOTTOM TANKS AND TOWERS

The all steel tank and tower is now the recognized type for storing water at an elevation. This is particularly true for the larger capacities as the cost of wood tanks is increasingly greater as the size increases. They are not economical compared to steel in capacities above fifty thousand gallons, except in cases where hard or acid water tends to pit the steel or the cost of heating is a factor.

An all steel tank and tower needs little care; only a coat of

paint every three to five years depending on local conditions and the furnishing of heat in severe weather. When once tight it stays tight, even when out of use, and therefore should always be used for intermittent service.

A tank and tower is superior to other methods of storing water as the entire capacity is available at not less than a fixed minimum pressure. This is supplied by gravity, an unfailing force which is superior to pumps or any mechanical source of pressure. For this reason tanks and towers are used for such services as city water works and automatic fire sprinklers where reliability is most important and are almost always all steel.

We specialize in tanks and towers for these two services as well as for other classes of water supply.

Our tanks and towers are accepted by all insurance inspection bureaus and they are to be found in most every state in the Union as well as in Canada, Mexico and other foreign Countries.

Caldwell
TANKS
AND
TOWERS

ALL STEEL TANKS AND TOWERS

The names of city and town water works for which we have furnished tanks and towers are listed on page 43. Some of these are more than twenty-five years old and still in service.

Industrial water supply is another important use and we are proud of the nationally known names on our list of customers, many of whom have several of our tanks and towers in service. Industrial water supply can be combined with sprinkler service, especially when large risers are used, as insurance authorities accept dual service installations where a separate pipe allows the use of the upper portion of the capacity for industrial use and still reserves the required capacity for fire protection.

The hemispherical bottom type is to be preferred for all ordinary uses except in very large sizes or where variation in water pressure must be kept at a minimum. In such cases the ellipsoidal bottom type is to be preferred.

The hemispherical shape is ideal for a suspended bottom for it carries the load with the minimum amount of stress in itself and does not produce unusual stresses in other parts of the tank. For this reason it will carry the same load with thinner plates than is required in the ellipsoidal shape. The actual stresses can be more accurately calculated as the curvature is uniform throughout and they are less affected by other parts of the tower.

The large steel plate risers, three feet and over in diameter, are used with either type without expansion joints and carry part of the water load. We recommend them in preference to wrought or cast iron pipe with wood frost casings for they do not need such casings and the elimination of the wood is a decided advantage. Their large size prevents their freezing easily and a heater can be placed inside the riser to deliver heat where it is most needed.

The matter of appearance and proportion is given prime consideration in designing, for we want each outfit to be an ornament for you and an advertisement for us.

See pages 40 and 41 for smaller sizes with Angle Towers.

ALL STEEL TANKS AND TOWERS

We have been building this type of tank and tower for nearly thirty years and are prepared to design or make it in any size under our own or your engineers specification.

We use only the very latest and best practice in our designs and shop methods. We are especially proud of the quality and accuracy of our workmanship. We insure proper fitting in the field by accurate layout and processes in the shop. This gives you a better job and saves us expensive correction of errors in the field. Each size bottom, for instance, is set up in the shop and the template is corrected until all holes fit without reaming. Note illustration below. We also set up all special construction to insure proper fit. The reports of our erectors prove the wisdom of this policy.

We can make these towers in any height required, but the usual heights are 50, 75 and 100 feet. We carry material in stock to make most any capacity or height desired and we also carry parts for the usual standard sizes in stock all finished. It is impossible to give list prices for this type of tank and tower on account of the multiplicity of sizes and constant variation in the cost of materials.

We will gladly send you a detailed quotation including erection and freight on any size you wish with prices on all accessories you might want. We will also include drayage and foundations if desired, but these can usually be more economically attended to by the purchaser.

SMALL HEMISPHERICAL BOTTOM STEEL TANKS WITH ANGLE TOWERS

The laced channel tower is not economical in the smaller sizes so some time ago we designed a standard series of angle towers for hemispherical bottom tanks which compare favorably in price with either steel or wood flat bottom tanks on standard towers.

We have made the tanks of three-sixteenths inch steel which we consider ample for these small sizes but we can furnish them in one-quarter inch thickness at an extra price for those who prefer a heavier tank.

The towers are designed in accordance with the latest specifications of the American Institute of Steel Construction. They are much simpler and more in proportion to the actual loads coming upon them. This is the same basis and construction as used in our Standard Angle Towers, that we have been making for a number of years, several thousand of which are now in use.

We carry the material in stock for the sizes listed and most of the usual sizes already made up ready to ship out. We cannot vary from these sizes except on special order at an increased cost.

The field joints of the tower are made with double nutted bolts but the tank is riveted. We recommend hot riveting especially in the larger sizes but cold riveting can be used for the three-sixteenths tanks. The erection is comparatively simple and can be handled by a good mechanic familiar with riveting and caulking or we can erect it for you.

Extra price, \$235.70. Extra wt., 4005 lbs.

Heights are nominal and measured from the top of the foundations to the low water level.

Prices include the tank with cover, balcony, hand rail and ladders from 10 feet above ground to balcony, a revolving ladder to the apex of the roof and an inside ladder, all with one shop coat of paint.

We supply plans and specifications for putting in the foundations.

We erect anywhere or we will furnish plans for the customer to erect.

These prices are subject to a liberal discount that will be quoted on application, or we will quote net delivered prices and to include erection when desired.

State what Insurance Requirements, if any, and whether we shall include Riser Pipe and Frost Boxing.

TANK HEATERS

For Wood or Steel Tanks

In severe climates it is necessary to provide heat in some manner to prevent the water in tanks and piping from freezing. Boxing and other types of covering will help, but will not do it alone except in mild climates.

Where steam is available we recommend the following types of heater:

STEAM COILS

A pipe coil can be used in the tank for tanks on the ground or on a building or not over 30 feet above. This is shown on page 45. It should be of brass or galvanized iron. Write for prices.

COIL TYPE HEATER

This type is used with cast iron or wrought steel pipe risers. It is intended to be used with ten pounds steam pressure.

The brass steam coil inside heats the water which rises through the heater pipe into the tank and is replaced by cold water from the riser pipe. This circulation prevents the riser from freezing.

The Tank Heater is hung on the riser pipe and is usually set in a

pit under the tower or in the top floor when the tank rests on a building.

The size heater needed depends on size and kind of tank, the pressure of the steam available and severity of climate. Price on application.

RADIATOR TYPE HEATER

This type is used with the large plate steel risers 3 feet and larger in diameter, usually furnished with hemispherical and ellipsoidal tanks and towers and is shown on page 45. It is placed inside the large riser and consists of a 2½-inch or larger pipe extending two-thirds the height of the riser or of proper length to give sufficient radiating surface. This pipe is sealed at the top and connected to a fitting welded to bottom. Inside is a 1-inch or larger steam pipe open at the top. Steam and drain connections are taken out at the bottom of the riser into the pit. The drain is usually led to a steam trap.

Where a steam supply is not available a gas or coal boiler can be supplied to furnish the steam. This usually is connected in a closed system to save water. In this case it is necessary to use larger steam and radiator pipes.

OTHER TYPES

Coal or gas-fired hot water heaters can be furnished where steam is not available. These take water out of the riser pipe in the pit usually at the base elbow, heat it and deliver it up into the tank. A shield pipe protects the hot water pipe in the large steel risers. Prices will be quoted on request.

Electrical heaters can be furnished, but they are expensive to operate, except at exceedingly low rates for current.

THERMOSTATIC CONTROL

We recommend thermostat control for use with steam heaters as they will save their cost in a short time over manual control. Prices on request.

RAILROAD TANK FIXTURES

Improved Valve, Outlet Pipe, Galvanized Spout and Fixtures

The above cut represents our Improved Tank Fixtures which are strictly frost proof. We furnish these in five sizes: 4, 6, 7, 8 and 10 inch.

PRICES FOR COMPLETE FIXTURES as shown above and including Triangle

	4 In.	6 In.	8 In.	10 In.
Fixtures for 10 to 14 ft. diameter Tank	\$105.96	\$144.00
" " 16 " "	125.97	154.02	\$216.00	\$298.02
" " 20 " "	164.01	226.02	318.00
" " 24 " "	174.00	236.01	338.01
" " 30 " "	195.00	256.02	368.01

Write for discounts and freight rates or state outside bottom diameter and outside height of tank, distance from center of track to center of tank and we will quote net delivered prices.

CALDWELL BALANCED FLOAT VALVE

5"	165	177.00	187.50
6"	225	250.00	262.00

If for Hot Water 180° F. add 10%.

The Caldwell Balanced Float Valve gives very reliable service. It is used on any tank or reservoir where a constant level of the liquid must be maintained.

Its design is simple and the balanced feature causes it to open and close easily and positively without having to have an excessively large ball as the float does not have to work against the pressure of the water.

The valve is rubber and upper packing is leather for cold water and hydraulic packing for hot. These valves are all brass up to 1 1/2 inches. Larger sizes are iron body with brass trimmings.

In ordering state whether cold or hot water is to be used.
